

Platform changes and moving legacy or heritage books of business to new systems can create a problem with what to do with 'closed records'.

It makes little financial sense to migrate and install closed policy records on to the new platform or software, yet the cost of maintaining the existing platform can be eye-watering and means business benefits are not achieved.

Of course, you have to be able to view these records in the unlikely event that you are challenged or have to provide information to regulators or customers.

It can seem like an extraordinary headache...

That's why ITM developed eArchive

eArchive is software based on ITM's eDAaRT migration suite which securely retains the data as a faithful representation of the legacy source system, allowing administrators to view the data when required through custom reports, and importantly to only view the data they should see thanks to inbuilt access controls.

With GDPR requirements just around the corner, **eArchive can help you meet your legal obligations** with your legacy data.

The software runs on modern commodity architecture, **providing a low-cost and compliant alternative for life companies** and insurers as the data structure is determined by the original system.
